MX – Mail Exchange record in DNS

- The MX records direct emails to the appropriate mail servers (appropriate destination)
- These records are publicly available thus can be used in attacks (phishing/spoofing)
- Phishing = form of cyberattack i.e use emails/messages to impersonate legitimate entities (social engineering)
- Spoofing = attacker forges identity to appear a someone else like the company CEO (IP spoofing, Email spoofing, DNS spoofing)
- Typosquatting/ URL hijacking = attackers register domains that resemble legitimate websites i.e g00gle.com instead of google.com

1) Before starting the analysis, Information about the incoming email should be obtained

Parse Email
